

CSCI-101 Programming I

Lab 3d

In your **lab3** directory create a program in a file named **WhileLoops.java**. Include in the program the statements necessary to achieve the following.

As you develop this program, and all other programs, save your file, compile, and test your code often.

1. Use a while-loop to print "hello" 5 times.
2. Ask the user to enter an integer. Read the value from the keyboard and store it in a variable named **count**. Use a while-loop to print "hello" the number of times stored in count.
3. Use a while-loop to print the whole numbers between **3** and **9**, inclusively.
4. Ask the user to enter two integers. Read the values from the keyboard and store them in variables named **lowerBound** and **upperBound**. Use a while-loop to print the whole numbers between the value in lowerBound and the value in upperBound, inclusively.
