

CSCI-101 Programmin I

Lab2f

When finished with any lab you'll need to copy your code to github. I assume in this tutorial that your working directory is **lab2**.

First, add all of the files that end in .java to the git change set.

```
git add *.java
```

Next, commit the changes to the local repository. Use the following command, replacing **MESSAGE** with a description of what you are committing (e.g. "submitting lab2").

```
git commit -m "MESSAGE"
```

Now push your committed changes to GitHub.

```
git push
```

Last, log into [GitHub.com](https://github.com) and verify that your files were properly pushed to GitHub.
