CSCI-101 Programming I
Lab 12

Inside in your **csci101/labs** directory create a file named Contest.java. In the file write a program that satisfies the following:

1) The program must simply output a single integer between 1 and 100 (inclusively) to the screen. The program should obfuscate the output so that the reader cannot determine which number is printed from just reading the source code.
2) The output of the program must be the same each time the program is run.
3) The file cannot exceed 3000 bytes.
2) The program must compile using javac on cs.bridgewater.edu.
5) The programs must be the work of the submitter. You may use the internet for ideas but you must type the code yourself.

Push your code to GitHub.
