

# CSCI-101 Review

## Arrays

Write a class named **Arrays** and in **main** do the following:

1. Write code that creates an array named **array1** that can hold 10 integers and initialize the array with values read from the keyboard. Print the values in the array to the screen.
2. Write code that creates an array named **array2** that can hold 10 Strings and initialize the array with values read from the keyboard. Print the values in the array to the screen.
3. Write code that creates an array named **array2** that can hold 10 characters and initialize the array with values read from the keyboard. Print the values in the array to the screen.
4. Compute the sum of the elements in **array1** and print the sum to the screen.
5. Compute the minimum value stored in **array1** and print the value to the screen.
6. Compute the maximum value stored in **array1** and print the value to the screen.
7. Count how many elements in **array1** that are even and print the count to the screen.
