

CSCI-432 Client-side Development

Create a new app named **app9**. The app should resemble a list of audio recordings on soundcloud.com.

The app is due Wednesday, February 22.

Visuals

- The app should display a list of meta data and audio controls for at least 10 sound recordings.
- Each list item should specify a label (e.g. name of sound, or title of track) and the recording's duration.
- The recordings do not need to be music. The collection of recordings should however have a theme.
- Each list item should have controls that allow the user to play and pause the recording.

Code

- Create a component that displays a single list item (i.e. recording).
 - The app stores the meta data (label, duration, path to audio file) in a file as a JSON object. The file must reside in your assets directory.
 - The app generates the list using the v-for directive.
 - The meta data for the recording are passed to the list item component via props.
-
