

CSCI-432 Client-side Development

Create a view app named app6 that displays the following form*.

The screenshot shows an 'Order Form' with a green header. Below the header is a green bar with the text 'Please fill in your information and we'll be sending your order in no time.' The form contains the following fields and controls:

- Name:** Two text input fields containing 'John' and 'Doe'.
- Email:** A text input field containing 'johndoe@domain.com'.
- T-shirt model:** Three radio button options with corresponding t-shirt icons: a green polo shirt, an orange polo shirt (selected), and a blue t-shirt.
- Size:** A dropdown menu with 'L' selected.
- Quantity:** A text input field containing '2'.
- Delivery Date:** A text input field containing '03/15/2017'.
- Delivery Address:** A group of four text input fields: 'Street Address', 'Street Address Line 2', 'City', and 'Postal / Zip Code'. Each field has a red asterisk indicating it is required.
- Purchase:** A green button with the text 'Purchase'.

- The user should not be able to select more than one t-shirt model.
- The size control should allow the user to select XS, S, M, L, XL.
- All of the fields except Street Address Line 2 are required.

The app must contain proper CSS to display the content as shown.

Bind reactive data to all of the fields and create a handler that when pressed prints to the console the reactive data as a single object in JSON format.

Push your app to Azure and include a link to the app on your Azure home page.
